

Teammate Plan

Live Vote · Monad Blitz Berlin · 26.09.2026

What she does in parallel while the builder works in Claude Code

Yes, she can definitely take the design. Here's what she can do in parallel with the build, in priority order.

Right now 13:20 – 13:45

1. Get test MON. This comes first, because it's the #1 blocker.

- Claim on blitz.devnads.com, use faucet.monad.xyz, and ask the mentors.
- Send the MON to the DEPLOYER and DRIP addresses that Prompt 0 prints. The goal is at least **10 MON**.

2. Check the rules with the organisers.

- Is the submission deadline 17:30 or 17:45?
- Is judging really 50% judges and 50% the room?
- Which fields does the submission form on blitz.devnads.com ask for?

Design 13:45 – 14:30 · the part that makes the room remember you

She makes a **short design brief** that you paste into Prompts 2 and 3. It's not Figma perfection; the brief itself says *"worry less about perfect UI"*. Contents:

- **Name + one-line tagline** (e.g. "Live Vote: every vote is a donation")
- **3 colours as hex codes plus 1 font** (from Google Fonts). The projector screen needs strong contrast and very large type.
- **A rough sketch of 3 screens** (paper, Figma or v0 are all fine):
 - 1. Phone:** the question, 3 big buttons, "next vote costs X"
 - 2. Projector:** the QR code, the bars, the counters
 - 3. Winner screen:** the winning cause, the amount, the explorer link
- **All text in the app:** the question, button labels, the line "No wallet, no app, just scan," and the success message after a vote
- **The 3–4 causes:** names plus an icon each

She can do this in the normal Claude chat, so it doesn't use up the Claude Code usage. A prompt she can use there:

"Create a compact design brief for a mobile voting web app called Live Vote, shown live at a hackathon on a projector. Give me: 3 hex colours, 1 Google Font, all UI text, and a layout description for 3 screens (phone voting, projector with QR code and live bars, winner screen). Keep the projector screen readable from 15 metres."

Pitch 14:30 – 15:00

- Write out the 3-minute pitch from PLAN.md section 6 and time it with a stopwatch.
- Optional: 1–2 slides (problem + roadmap). No more than that.

Test users 15:00 – 15:45

- **Recruit 5–10 people from other teams** to scan and vote at the same moment. That's the real load test.
- Take notes: where did people get stuck, and what was unclear? Pass it on as a short list.

Backup video 15:45 – 16:15

- **Record a full run** with the screen and a phone. On Windows, `Win + Alt + R` starts a screen recording.
- Save it locally and upload it to Drive as well, in case the laptop dies.

Submission 16:15 – 16:45

- Prepare the submission text: description, how it works, why Monad, and the links (provided after Prompt 6).
- Take 2–3 screenshots for the form.
- Rehearse the pitch twice, with the builder playing the audience.

After the pitches

- Post on X with a short demo clip and tag **@monad_dev** and **@encodeclub**.

Hand-off points between you

- 13:45** She gives the builder the MON.
- 14:30** She gives the builder the design brief, which goes into Prompt 2.
- 15:45** She gives the builder the test feedback.
- 16:30** The builder gives her the final links.
